

MOB-trak is a personal recovery beacon. Water activated, it generates an audible alarm on the Base Unit (on vessel or platform) and tracks the MOB position on the electronic chart system.

When an MOB event occurs, marine professionals are trained to respond. This can be crew from a Yacht, Safety vessel or Platform. MOB-trak allows those closest to the incident to respond first.

Immediately an MOB signal is received, the Base Unit alarms, plots the position and activates the camera drive. To aid visible MOB location the unit has an UltraBright strobe LED, visible from 1Km.

A robust, floating enclosure, with long battery life and seamless integration to chart, ensures that within seconds of an MOB event, those closest in the position to recover quickly, are tracking you.
